About this document

This document provides information about the changes, enhancements, known issues and limitations, and the defects fixed in this release.

What's new

- Process Assessment- An API has been introduced that accepts Jira instance details and a release name as input and retrieves data from the last three sprints.
- Velocity metrics have been integrated into the NorthStar flow to help validate project plan feasibility more effectively.
- Designed and implemented the UI workflow for average velocity- based project plan validation and adjustments to enhance planning accuracy and efficiency.

Known issues and limitations

Feature	Limitations
Bulk Upload	The bulk upload feature is not supported in the admin user interface.
Adding Green Field Project	The green filed project can be added by providing the dummy data for the Project management tools and source control tools.
Guideline	The Guideline feature does not work as intended. However, the uploaded documents are stored successfully in the North Star database (DB).
Perform Assessment View	<ul style="list-style-type: none"> • When multiple users access the application simultaneously or when working with large repositories, the Project Scan process may take longer to complete. Users are required to wait until the scan finishes before proceeding. • A few files in Code Analysis show <code>Failed to load content</code>.
North Star View	<ul style="list-style-type: none"> • Velocity: After publishing from Draft and viewing it under Future Release, if additional use cases or epics are added later, the newly added epics are not reflected in the Future Release. • Add release > Project Plan preview. If the network drops on this page while creating details, user cannot retry or proceed and must recreate the plan/step. • Use Case Count Fluctuation: When manually adding use cases after generating details, the use case count may increase unpredictably upon re-generating with selected new and old use cases. • Incorrect SCM Message for Non-GitHub Projects: Selecting an unmapped release in a non-GitHub project incorrectly displays a "GitHub only" message. The message should reflect the actual SCM tool configured. • Add release: Before Publish release - Testcases field shows blank and displays API error.

Feature	Limitations
	<ul style="list-style-type: none"> Agile Assessment Report API Failures: Clicking on Process Assessment → Agile Assessment Report triggers some API calls that fail with a 404 Not Found error. Backlog View: The Project tab displays <code>data curation in progress</code> for Summary, Code Analysis, Project Diagrams, and Features.
Project Backlog View	<ul style="list-style-type: none"> ML Analysis Gaps: Machine learning analysis is not populating data for certain backlog features, leading to incomplete insights.ts. Aha Tool Integration: When creating a backlog project using the Aha tool, the "Priority Backlog" and "Business Case for Selected Projects" pages fail to populate with data. PDF Download Failure in Detailed Analysis: Attempting to download the detailed analysis PDF results in a font-related error.
Security Assessment	The Security Assessment process can get into a continuous loop for various background processes, and the UI shows the loading message.

Fixed defects

Feature	Defect	Solution
NorthStar view	After publishing a release in NorthStar view, the release was not appearing on the published page until the page was refreshed.	The API call has now been added, and the loader behavior has been fixed to properly indicate progress while fetching the release details.
NorthStar view	In the Draft Release section, the export options label was incorrectly displayed as - Export pdf and Export Excel.	The labels have been updated to more appropriate wording- Export to PDF and Export to Excel.
NorthStar view	When saving a draft on the Use Case list page in a Northstar view project, it was redirected to the Release assessment page instead of the Drafts page.	The issue was resolved by updating the store using the <code>setFilterSelect</code> method with the value 'drafts', ensuring the page filter is correctly set to drafts upon landing on the Release Timeline page.
North Star	The application was crashing out intermittently during sign-out.	A proper null check has been added to prevent the crash.
